

Dear Hiring Manager,

My `Huego.ai` project, a medical RAG chatbot built over 1,000+ pages of medical literature, directly addresses the need for engineering complex RAG pipelines and deploying full-stack AI applications. This system runs on FastAPI and Next.js, containerized with Docker and deployed on AWS.

At Mercor, I enhanced a matching engine across 4M+ profiles using embedding and reranking strategies. I also migrated a candidate profile service to FastAPI, reducing latency from 2 seconds to 200 milliseconds, a 10x improvement. These efforts demonstrate experience in optimizing ML serving infrastructure and system design at scale.

The mission of Flipkart's AI Solutions Org to accelerate AI adoption across the company aligns with my experience in building and optimizing AI-powered systems. Let's discuss.
